

Political will for prioritizing threatened marine resource management efforts can help protect habitats to ensure ecosystems last into the future. [Management](#)

Then Blue food systems

Fish plays an important role in food systems. People have never consumed as much fish as in the 1960s, to 23.3 kg in 2020, has doubled. Fish enables countries to achieve healthy diets, balanced diets that prioritize animal-source income countries. Fish is a key food system.

And aquaculture

The current world population demand for healthy marine animal and large-scale marine production was over 150 million and consumed. Seafood production role in the production of food. Technological advances and policy frameworks should ensure that allow for the sustainable production of fish.

At least Blue communities

Fish and fish products are important. Approximately 85% of global fish brings jobs and economic growth. In 2024, developing trade value and almost 60% key to achieving sustainable development simultaneously through the development of these pop-
